Abstract
An 83 year old man presented to the surgical OPD with the complaint of painless giant swelling in the scrotum for 5 years. The swelling was initially small in size, which increased to the size of a small football. Clinical examination revealed an extra-testicular swelling which was soft in consistency and the testis was palpable separately. After all base line investigations, it was operated. Findings revealed a cyst containing cheesy white material. On histopathological examination, it was confirmed to be a case of epidermoid cyst of the scrotum. Giant extra-testicular epidermoid inclusion cyst is a rare entity. We are reporting it to increase the awareness of the management of giant scrotal swelling.

Introduction
Epidermoid inclusion cysts are the most common condition of the skin. These can occur in different parts of the body like the face, neck, scalp and trunk. The term Epidermoid inclusion cyst can be defined as the implantation of epidermia material into the dermis. It may result from proliferation of epidermal cells within the circumscribed space of dermis. An Epidermoid cyst is a benign condition and which is well circumscribed, and encapsulated. Histopathologically, it consists of the cystic lining of stratified squamous epithelial cells without any cutaneous adnexal structures in the stromal tissue. The extra-testicular epidermoid inclusion cyst is a rare condition as compared to an intratesticular cyst, which is a common benign condition.

While searching the literature, only a few cases have been reported around the spermatic cord, perineal area, etc. In this report a giant epidermoid cyst from the posterior wall of the scrotum has been reported.

Case Report
An 83 year old man came to the surgical clinic with the complaint of an irreducible swelling in the scrotum which was there for the last 5 yrs. Initially, a small swelling was noted on the left side of the scrotum. The swelling increased, gradually and finally occupied the whole of the scrotum. The patient described his scrotum as a bag in a bag, due to the giant swelling.

He was uncomfortable and the swelling was irreducible. It was measured to be about 20 x 18 x 22 as shown in picture No.1. It was soft in consistency, transillumination was absent, and was separable from both the testis and overlying skin. The skin surface appeared to be normal. The patient also had some symptoms of bladder out flow obstruction.

All base line investigations were done including ultrasound prostrate and scrotum. The ultrasound revealed well defined hypo echoic area in the scrotum separated from the testis like a hematoma, aq organized hydrocele with 65 gm weighing prostrate with a post residual volume of 15 ml.

For excision of cystic mass an operation was planned. The cyst was identified as a well circumscribed mass in the scrotum and the testis was separately present in the upper part of scrotum. The whole mass was excised as shown in pic 2. It arose from the posterior wall of scrotum, containing yellowish white cheesy material in it.

Histopathology was done and it confirmed that the cystic mass was an epidermal inclusion.

Discussion
The epidermoid cyst is a condition of the skin and commonly occurs on the scalp, face, neck, trunk and back. It is characterized histologically by stratified squamous epithelial lining of the wall containing loosely packed lamellae of keratin debris, cholesterol,
and water, without teratomatous elements and skin appendages in the stromal tissue.

As discussed earlier it is commonly present all over the body but rarely occurs in the genital and perineal areas. The main contributing factor for the development of epidermoid cyst is mechanical pressure and a history of minor trauma. However, as extra-testicular epidermoid cyst can develop due to abnormal closure and is associated with a degenerative process of the median raphe and urethral groove. An Epidermoid cyst can be inflamed and infected, resulting in regional pain and tenderness, and may be associated with foul smelling cheesy discharge. However, malignant transformation may be indicated by a rapid increase in size, and bleeding is rarely reported. As far as radiological diagnosis is concerned an ultrasound is the investigation of choice for inguinoscrotal swelling. Ultrasound is helpful to differentiate between inguinal and scrotal swelling, testicular and extra-testicular swelling and cystic and solid swellings. However this may not provide a confirmatory diagnosis. Besides an ultrasound, a CT scan or MRI may be used especially if the extension of mass into the pelvic cavity is suspected.

The main treatment of epidermoid cyst is a complete excision of the cyst. Recurrence may occur if a portion of the wall of the cyst remains during surgical removal. The case of giant extra-testicular epidermoid cyst is a rare presentation and after intensive literature search very few cases have been reported nationally. For these cases diagnosis was difficult and provisionally the swelling was considered to be a hematoma, an organized hydrocele and an inguinal hernia in our differential diagnosis. Hence, we concluded that epidermal inclusion cyst should be considered as a rare differential diagnosis of scrotal swellings. Surgical excision may be performed with great care in these types of patients in order to avoid iatrogenic injury.

INSTRUCTIONS TO AUTHORS

The Journal of Baqai Medical University is a biannual journal of medical and related sciences published by the Baqai Medical University. The journal is intended as a vehicle for the young medical scientist, research workers as well as senior scholars, for the exchange of information and publication of their research findings.

The manuscript prepared, according to specifications, given below, should be submitted to the Editor, Journal of Baqai Medical University. The Journal will be published twice a year (January and July) and the following categories will be included:

a. Original scientific articles.
b. Review articles on important medical topics.
c. Case report of educational value.
d. Short communication for quick dissemination of information.
e. Letters to Editor.
f. Book review.
g. Announcement regarding important meetings, workshops, seminars and other events relating to Health Sciences at national and International level.

1. Two complete copies of the manuscript, typed in double space on one side of the paper, with clear margin of at least one inch on both sides, are to be submitted for consideration. All words that are meant to be italicized should be underlined.

2. The manuscript should be based on an original work, which has not been submitted or published elsewhere.

3. All papers submitted for publication are subject to review by experts in the area of specialization.

4.(a) The responsibility for the scientific contents and statement made by the author(s) of the accepted paper, lies solely on the author(s).

(b) Written consent of all the authors on a prescribed proforma is essential.

(c) Copyright of the paper should be transferred to the Journal.

5. Manuscript with language deficiencies, error in syntax and typing mistakes may be returned back or may cause unnecessary delay in publication and therefore requires a thorough examination before submission.

6. The title page should contain, in addition to the article, Title, Author(s) Name(s) and Address, Key word and Abstract of the paper of up to 200 words. The name of the corresponding author should be properly indicated.

7. Tables, Photographs (on glossy paper) and illustrations to be submitted in duplicate, separately. Legends of the illustration, tables etc. should be typed on separate sheet. Formulae to be written by hand. Photograph(s) should be submitted only when extremely necessary and data can not be expressed in any other form.

8. The manuscript should be divided into the following sections for uniformity’s sake.

- Abstract, Introduction
- Materials and Methods, Results
- Discussion
- Observation (if applicable) Conclusion
- References

9. References to be numbered as they appear in the text and listed serially at the end.
